

# Test task

## for Front-end developer

Create a simple User management application with React.js. The application styles and template/structure should be implemented using any JS library or CSS styles (up to you). The direct things you have to implement:

- A table with Users (some columns showing information for each user instance);
- Clicking on a row redirects to the user edit page that provides a way to edit the instance (a simple form with error handling) and after that redirects to the main page (User table for instance);
- Add a button to Create a new User and interface to achieve it;

Additional features you can implement:

- Search over Users by first, last name for example;
- Pagination over User list;
- Real routing;
- A simple authentication;
- Some other things you think are ok to implement.

Good Luck!
